Homework - Defect Removal and Effectiveness

(1) Effectiveness of code inspections (during coding phase) = # defects removed / (# defects removed + # defects soon found)

==> $61/130 = 46.92\%$

*Only less than half of code defects are removed within the coding phase. Generally not good!

(2) Effectiveness of unit testing = # of actual defects removed during testing / # of defects removed prior to testing

==> $32/82 = 39.02\%$

*Relatively low effectiveness!

(3) Requirements PCE = $5/15 = 33.33\%$

(4) Release defect density = # defects found in field / code size

==> $18 \text{ defects} / 30 \text{ KLOC} = 0.6 \text{ defects per KLOC}$

*Relatively good. Product is potentially shippable.

(5) Coding defect injection rate = # defects introduced during that phase / code size

==> $61 \text{ defects} / 30 \text{ KLOC} = 2.0333333... \text{ defects per KLOC}$

*Relatively good. Product is potentially shippable.
